

Multiple Location Example

- Multiple ISP Connections
- Secure networking between locations

Product Options:
TM0100 - Two ISPs
TM0300 - Three ISPs or DMZ
TM1000 - Fault tolerant 24x7

- ▶ Use multiple connections to the internet for performance and reliability. Distributed technology balances traffic across all active connections and automatically compensates for link failures and restorations.
- ▶ Securely connect multiple offices through redundant VPN connections that load share using the same technology used for multiple ISP connections. ISP downtime doesn't have to mean network downtime.
- ▶ The connection based firewall allows you to control what types of traffic are allowed and denied via simple to understand firewall rules. Easily create policies for office to internet and office to office connections.
- ▶ Use QoS to prevent large file transfers or other low-priority traffic from adversely slowing important, high-priority traffic. Save on long distance charges by reserving bandwidth across your secure inter-office network for Voice Over IP.
- ▶ Titanium Mirror's distributed object technology automatically manages the complexities between services. Change a remote office's external ISP-provided IP address and the system will automatically adjust VPN, firewall rules, routes, and other services without manual intervention.
- ▶ For additional reliability, use the TM1000. The TM1000 incorporates hardware fault tolerance for true 24x7 operation via hot-swappable power, cooling, and processing modules. Its distributed technology is far superior to standby or 'cold spare' approaches which can mask failures or misconfigurations in the standby gear until they are needed most.

* All models provide ethernet and optional wireless connectivity. The TM1000 supports additional media types. Most ISPs deliver a hardware component that provides an ethernet connection for customer equipment.
